Aisling Kirwan is the co-founder and COO of Positive Carbon, which provides food waste data to commercial kitchens to enable them to cut their food waste in half, reduce waste collections and reach sustainability goals. With a BSc in Biochemistry and Cell Biology from Trinity College Dublin, Aisling had been working in the food waste sector for over eight years across Ireland, the UK, Australia, and Chile, before establishing Positive Carbon in 2020, with her former colleague, Mark Kirwan. The inspiration for the new start-up company came from Aisling's passion to make as big an impact as possible on the one million tonnes of food waste produced in Ireland each year.

From the start, Aisling and Mark's focus has been on the foodservice and hospitality sectors which, unlike the retail sector, had no technology solutions to the food waste problem. While not ideal to start a company during a pandemic, "we were in research mode and people had more time" says Aisling, "so we spoke to hundreds of Chefs, General Managers and Operation Managers to understand their pain points, and also to understand the dynamics of a busy kitchen".

They discovered that the need was twofold: firstly, visibility of the food waste, and secondly, nothing other than a fully autonomous solution would work. So, they created a tool that automatically monitors all the food waste in a business where sensors track and analyse every single item of food that is thrown in the bin. "All of this captured data is presented on our reporting dashboards where kitchen staff, operation teams and management can easily review daily, weekly, and monthly waste reports" says Aisling.

Aisling's determination to focus on sustainable focused businesses was successful with Managing Director Matthew Ryan from The Grand Hotel, Malahide becoming the company's first customer. Recommendations followed and Positive Carbon's customer base has grown across the foodservice and hospitality sectors in Ireland. Customers include KSG, the third largest food service provider in Ireland, Gather And Gather and KC Peaches, as well some of the largest multinational companies and hotel groups in the country, including Dalata Hotel Group, Leonardo Hotels, Talbot Hotels and Hayfield Family Collection. Customers on campuses include HSE, ATU and TU Dublin. Partnership with Positive Carbon is helping all of these to understand their food waste and save costs.

Positive Carbon received significant funding early on and is backed by some of Europe's most prestigious investors, including Berlin based venture capital company, APX, as well as Enterprise Ireland. In October 2023, the company completed a further funding round of €2.3 million, with BVP leading the round.

With this funding in place, the company is poised for further growth in Ireland, as well as entering the UK market, its first export market. "Every year, one third of all food we produce goes into the bin, that equates to 1.3 billion tonnes of food, costing the economy \$1 trillion and contributing to 10% of all greenhouse gas emissions" says Aisling. "Food waste is a global problem, and we plan to be a global company that makes a tangible difference."

Aisling is a proud member of the Going for Growth Community having participated in Starting Strong in 2021, Going for Growth the following year and Continuing the Momentum in 2023.
